

Specs currently stores a dynamic library of nearly 350,000 unique compounds. We are regularly offered compounds that we cannot add to our compound repository because they do not meet our selection criteria.

Specs recognizes the importance that these compounds might play in certain screening platforms or synthesis campaigns. These unique off-stream compounds, for instance from ancient academic collections, is an unfiltered collection of compounds that is offered to us by our network of academic and research institutes from all over the world.

The academic compound library

The chemistry through which these compounds are obtained is often distinct and not generally accessible through other databases or suppliers. The compounds in this academic database are not

supplied from stock but will be ordered from our suppliers which may lead to somewhat longer delivery times. The quality and integrity of these compounds is checked in-house by LCMS and/or ¹H-NMR to meet our quality control guidelines (screening compounds >90%, building blocks >95% and natural products >80%).

Ordering

Currently the Specs academic compound database holds over 380,000 structures and is available for download from our website through your personal account. Prices are indicative for amounts of 10mg and include the costs for quality control analyses.

If you have any questions concerning this special database, please contact us at info@specs.net.
